Regional Stormwater Action Team
The Regional Stormwater Action Team coordinated stormwater projects across the Puget Sound region by partnering with local Conservation Districts.

Project outcomes
Working with local Conservation Districts to build capacity, this project accomplished:

- Installation of 2 commercial gardens and 4 residential garden clusters
- Trainings on stormwater demonstration projects
- Outreach and recruitment for project sites
- Detention pond training class
- Increased capacity of 8 partner conservation districts
- Presented project outcomes

Success stories
Working together, this project was able to successfully continue through the pandemic. Each of the conservation districts involved in the project found ways to work around the issues caused by the pandemic. Outreach and recruitment were especially difficult, but we developed effective strategies to contend with those challenges.

Working with partner conservation districts across the Puget Sound contributed to a shared learning environment. This project successfully engaged partner districts and provided learning opportunities that will help them increase the reach of their own programs. This work resulted in a closer connection between districts, and an ongoing partnership that will be carried forward.
