Unincorporated GSI Incentives
This project will implement Green Stormwater Infrastructure (GSI) on private property in targeted areas of unincorporated King and Snohomish Counties.

What we’re doing
We will install several raingardens at homes, businesses, and community gathering places in both King and Snohomish Counties. Each garden will be designed by professionals with input from the homeowners. The gardens capture and infiltrate stormwater on site, reducing excess runoff that carries pollutants over impervious surfaces and into nearby waterways. Rain gardens also help to reduce overloading of sewage and stormwater systems.

What You Can Do
Contact us to get involved! We are looking for participants in unincorporated King and Snohomish counties. If you are interested in GSI for your home or community, and want to be a part of this project, contact us at the information below.

About Snohomish Conservation District
Snohomish Conservation District is a political subdivision of state government with no regulatory authority. We have been working with farmers, city residents, rural and suburban landowners on a voluntary basis since 1941. We operate with a diverse staff ranging from engineers, resource planners, community conservation staff, restoration specialists, a field crew, outreach specialists and administrative staff.

Why this issue is important
We know that stormwater runoff is flooding and polluting our rivers and harming local fish populations. GSI installations are effective solutions for mitigating stormwater runoff and reducing wear on municipal stormwater and sewage systems.
